Hello Dr. Zwick,

I am a hydrologist at the USGS here in Portland. Alan Yeakley recently forwarded your email looking for data that students in your Data Mining with Information Theory class could possibly use for their projects. My work at the USGS is focused on contaminant transport in surface water - specifically, regional regression modeling of watershed attributes on contaminant flux. I've compiled large, tabular data sets that might be useful to your students. I'd also be curious to see what kind of relationships a student might find using your data mining methods compared to the more traditional regression analysis I use. Feel free to have one of you students contact me if they have any interest in my data.

Dan
