

## Spread of Dutch Elm Disease in Ladd's Addition Portland, Oregon

BY JUAN GONZALES,  
DAVID DEARTH,  
AND ANGIE CIRELLO

### Research Question

- Where are the Dutch Elm Disease hotspots in Portland, Oregon?
- Which trees in Ladd's Addition are most at risk for DED?

## Dutch Elm Disease

- Caused by fungal pathogens
- Spreads easily, primarily through elm bark beetles, but also through root grafts and human activity
- Affects primarily American Elms
- Results in tree death

## DED in Portland

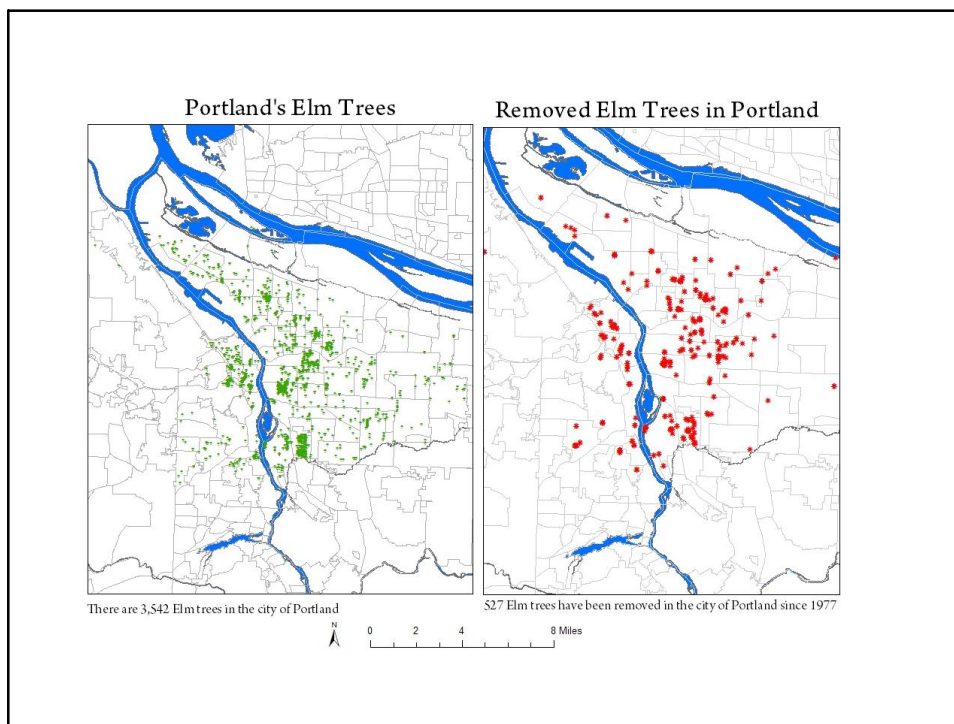

- City of Portland began monitoring the city's more than 3500 elms in 1986
- Involves seasonal inspection of trees, twig analysis, rapid removal of sick or dead elms, proper disposal of sick elms, inoculation, and community education
- Save Our Elms is also working in several Portland neighborhoods to preserve street trees
- Urban Forestry Commission and Eastmoreland Tree Association are also working with this disease

## Why Study Dutch Elm Disease?

- Trees important to ecosystem
- Urban Canopy
- Livability of neighborhoods

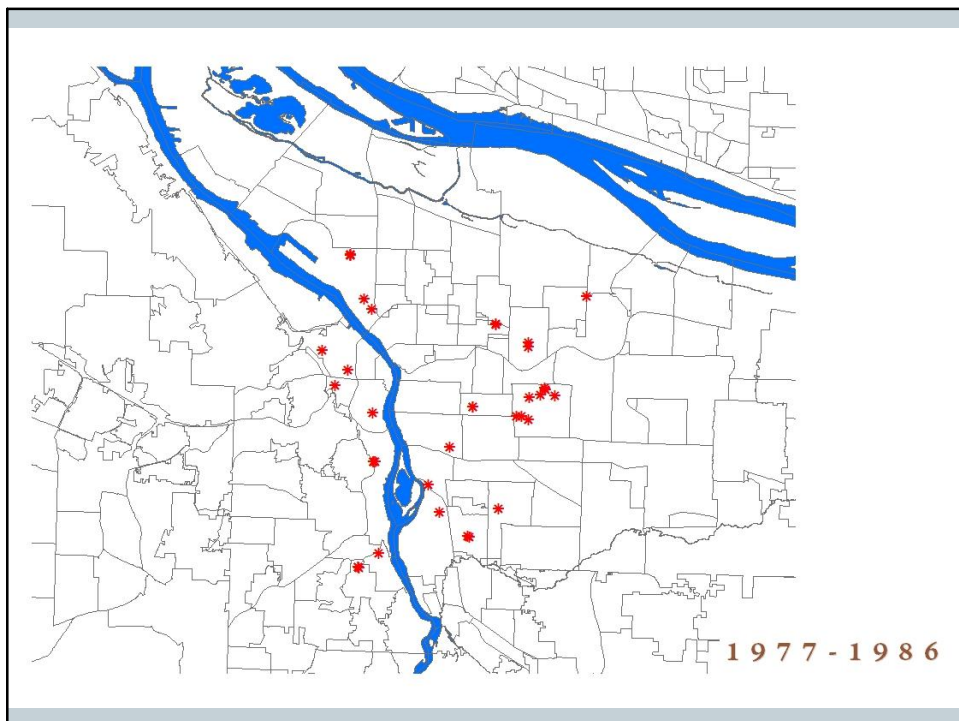

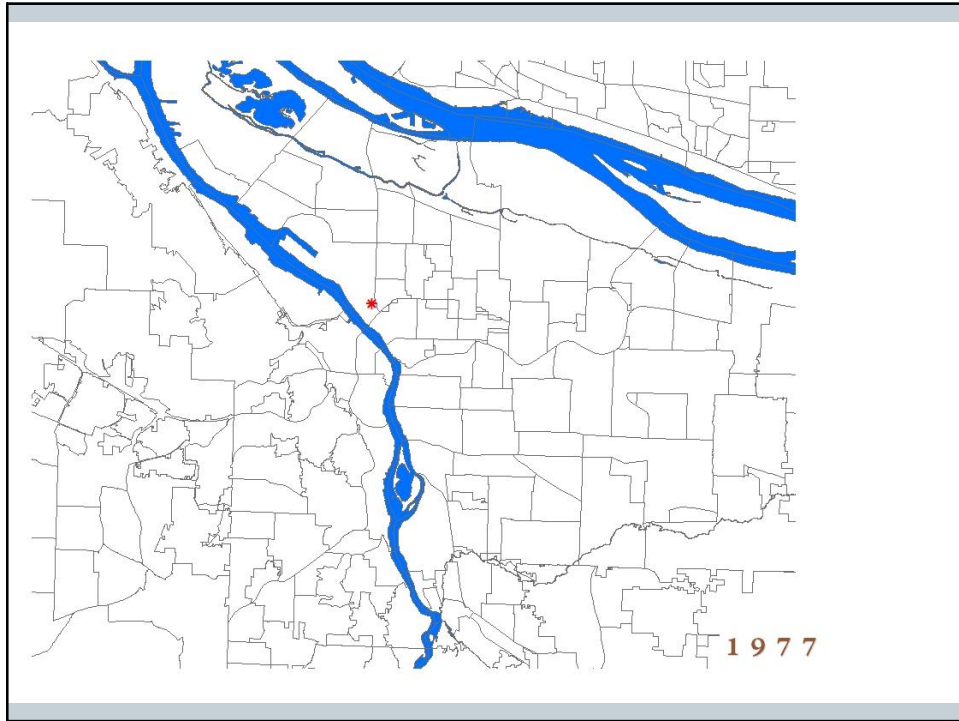

## Data Sources

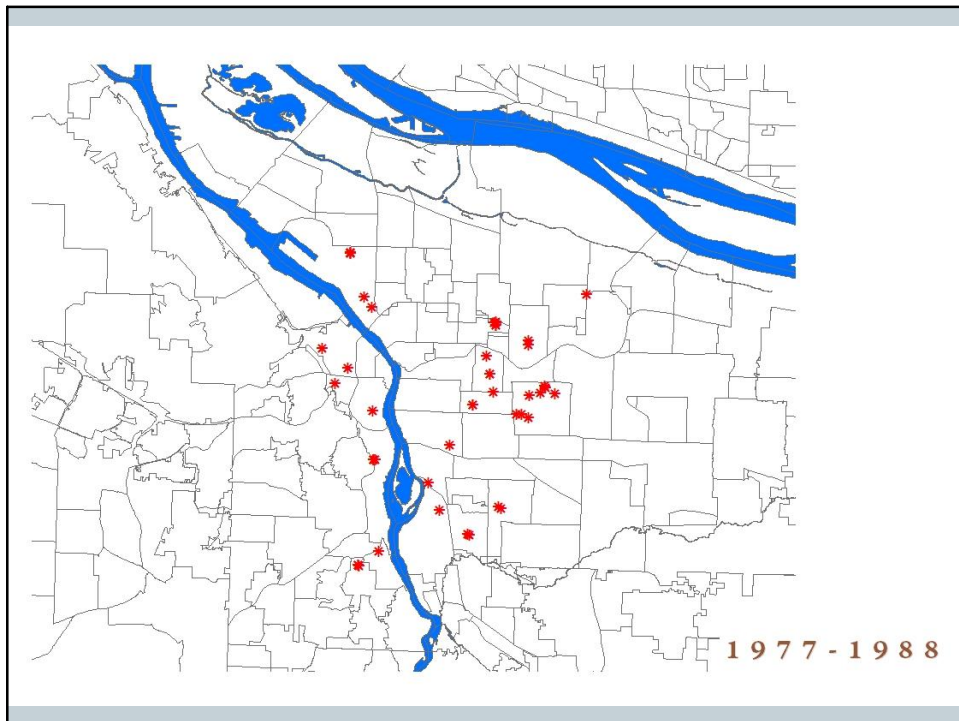

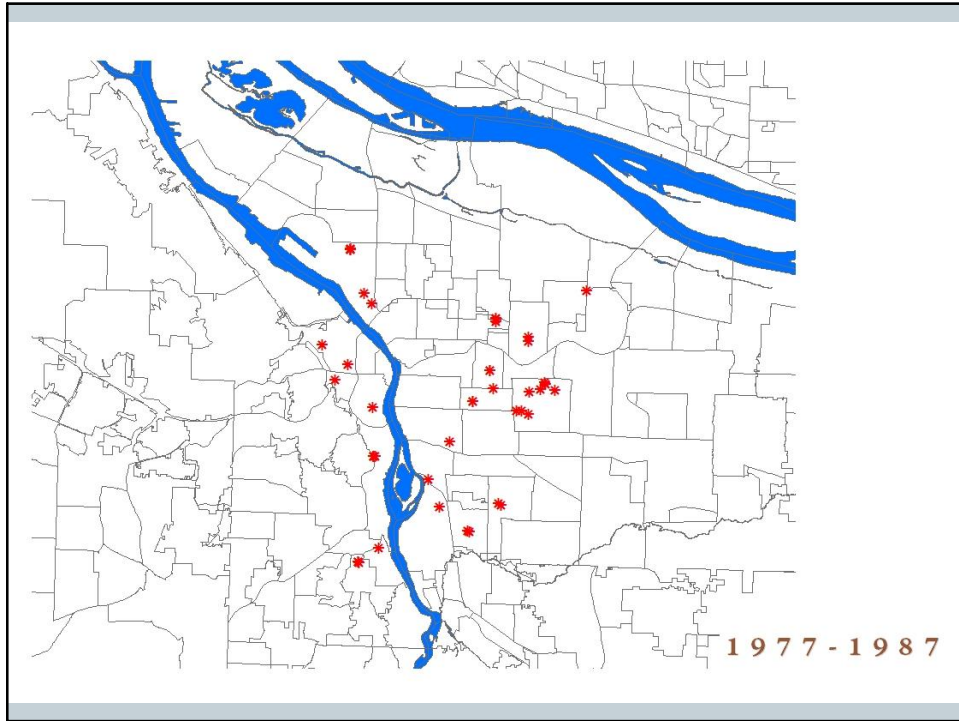

- **RLIS**
  - Tax lots
  - Road Network
- **City of Portland**
  - Elm tree data
- **Save Our Elms**
  - Ladd's Addition Elm data
  - Pruning Initiative
  - Inoculation Cycle Records

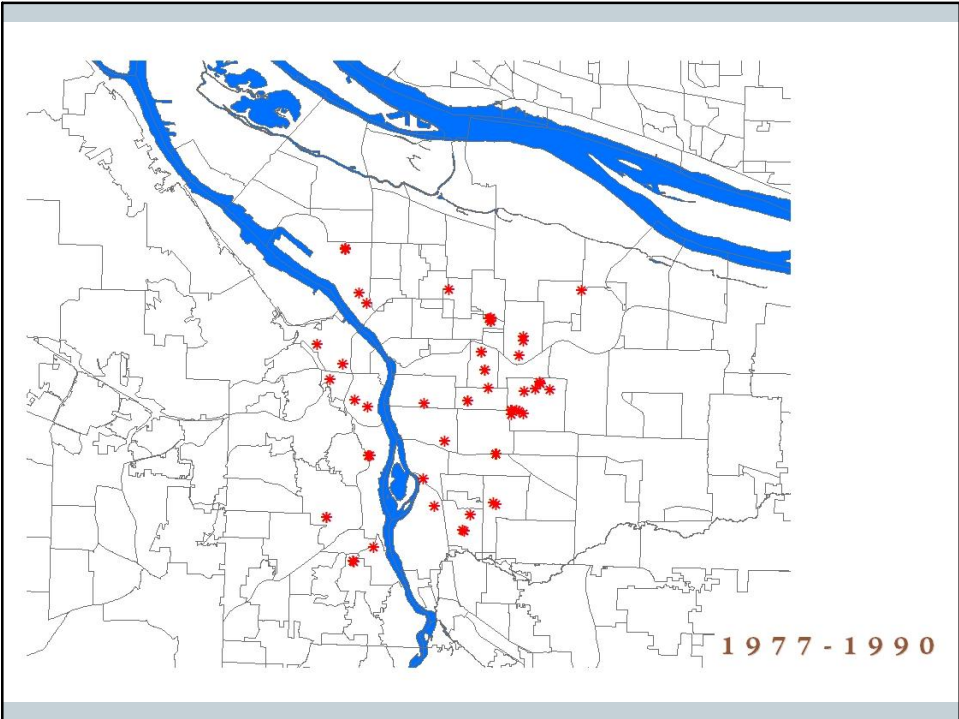

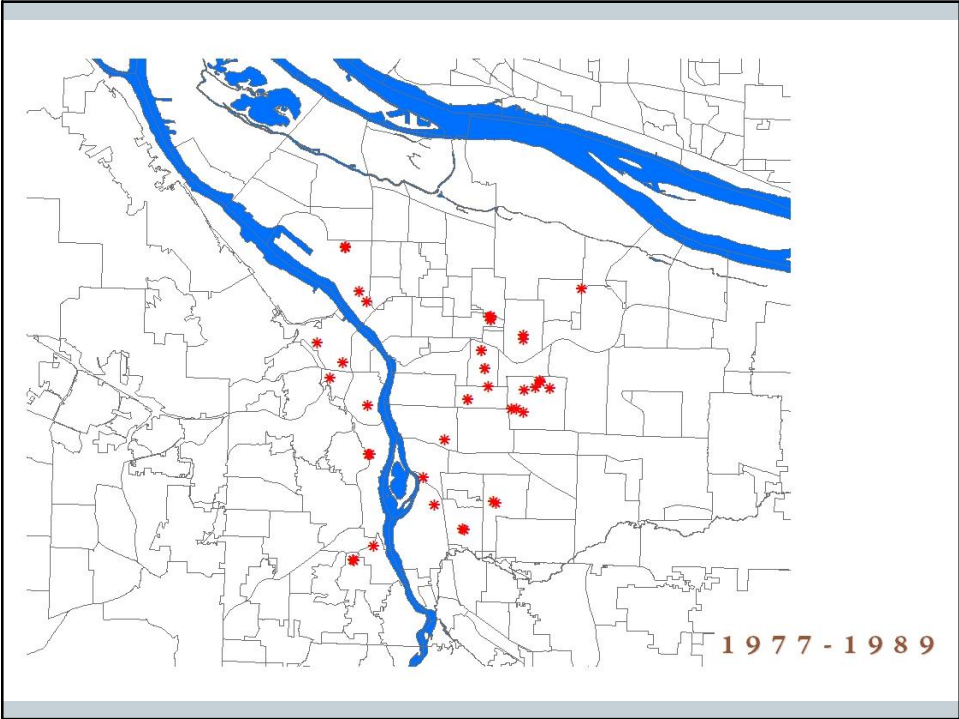

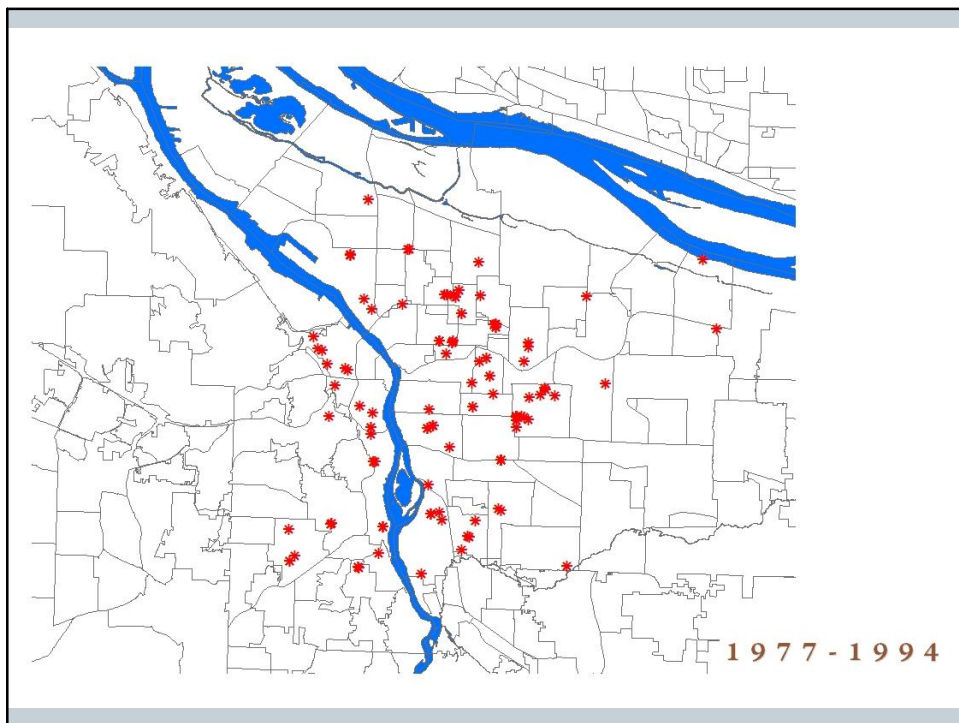

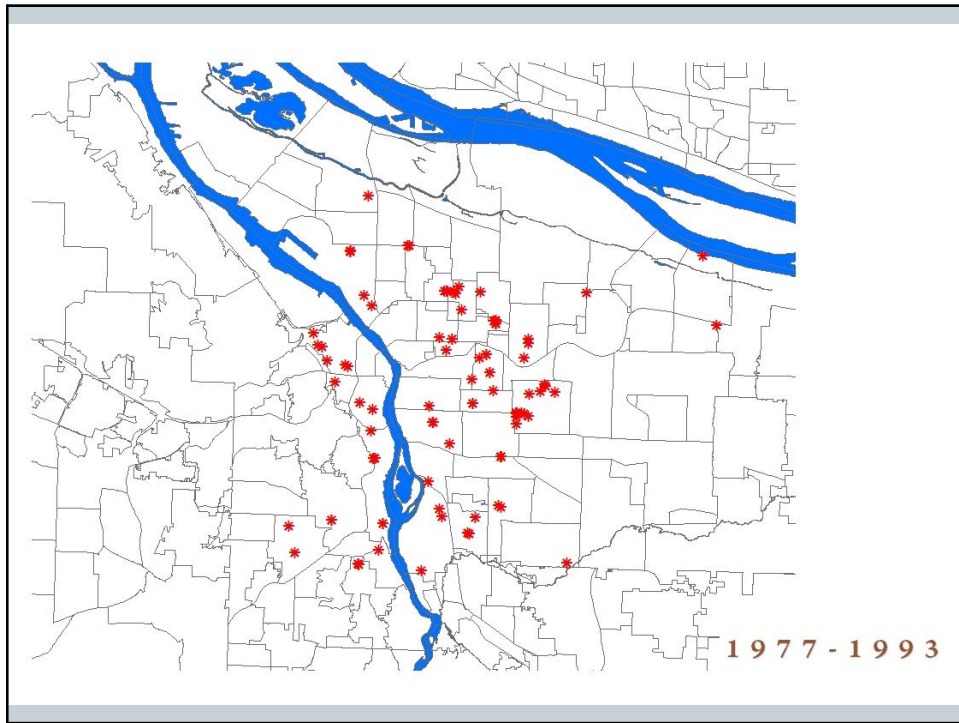

American Elms that have been removed since 1977 due to Dutch Elm Disease

- Identify spatial patterns
- Recognize hotspot of DED in Portland
- Visualize physical factors that might explain the patterns

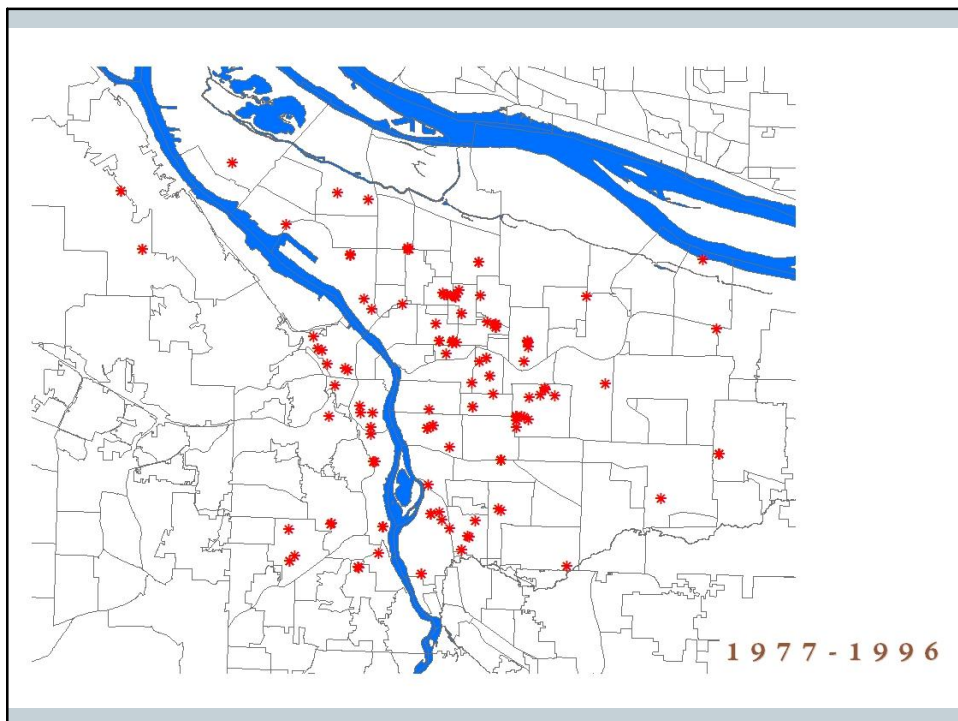

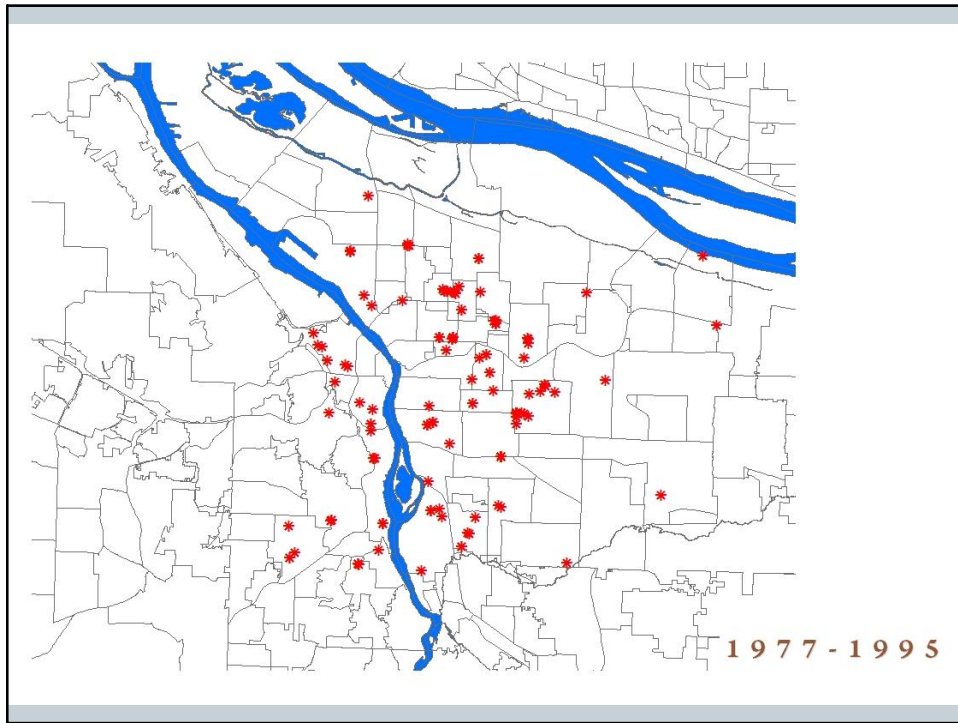

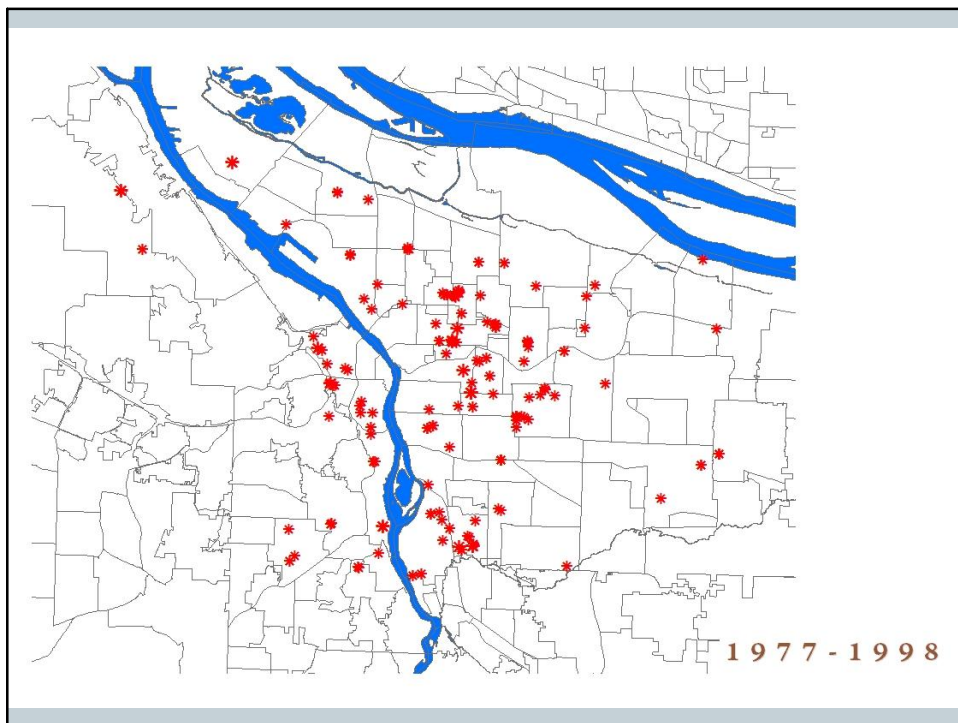

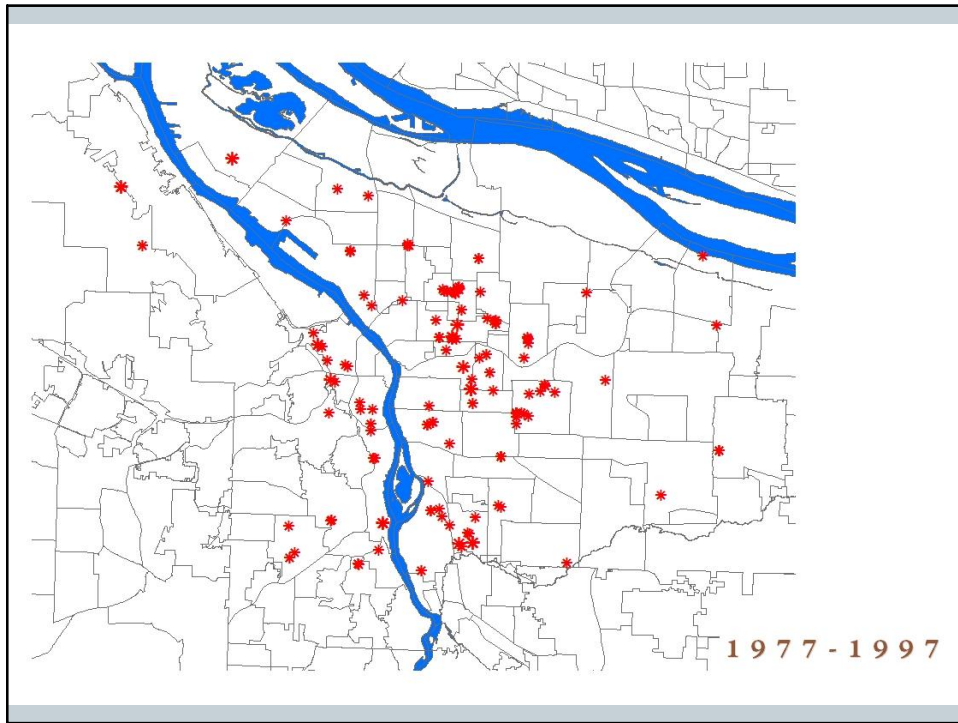

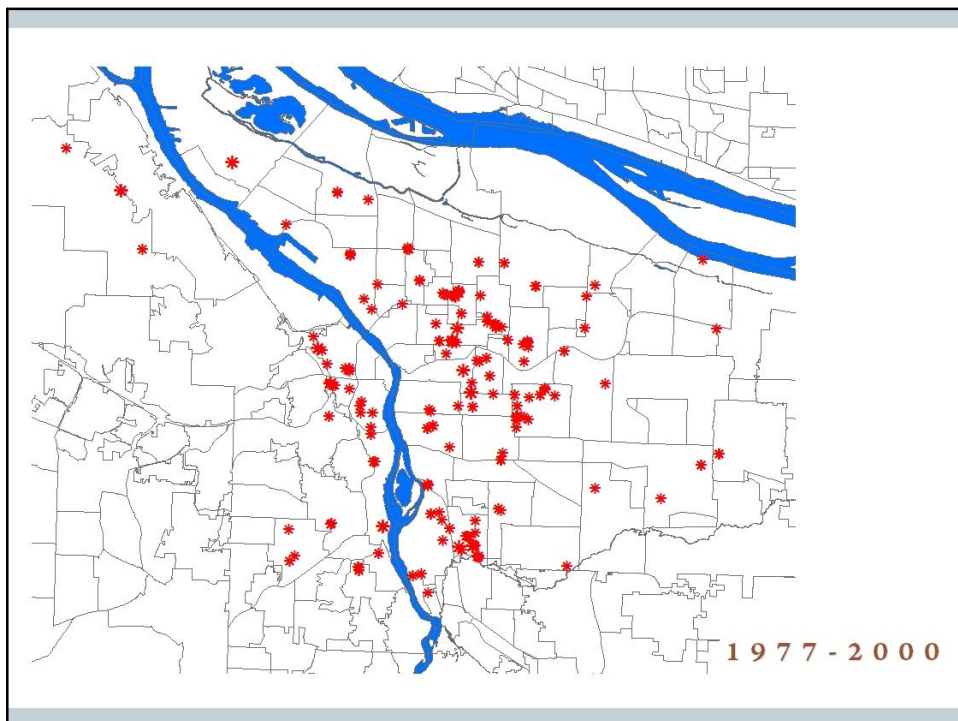

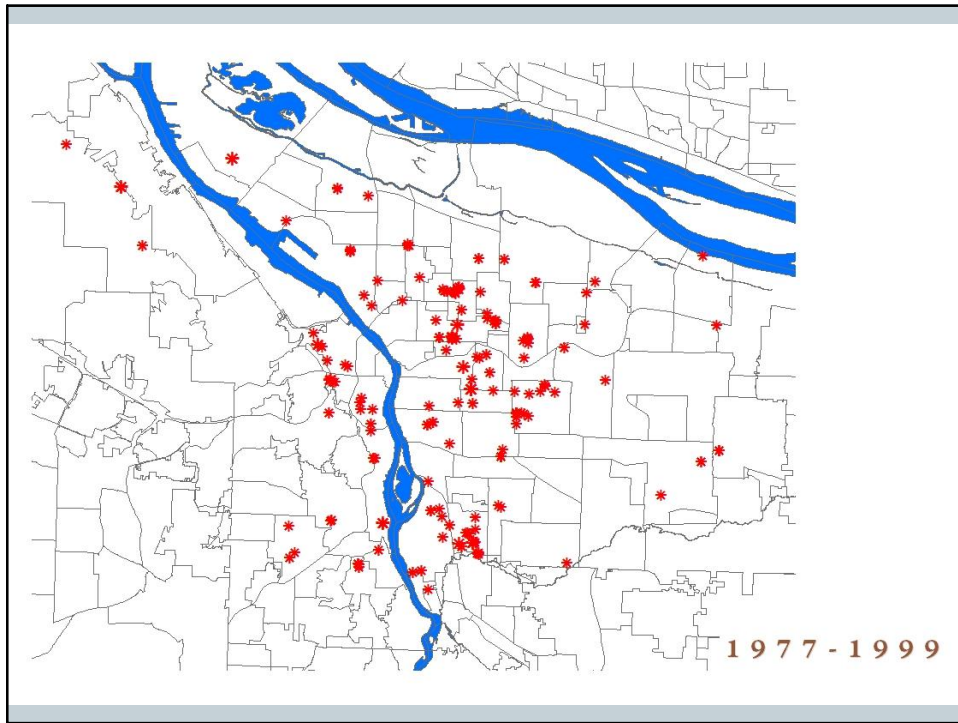

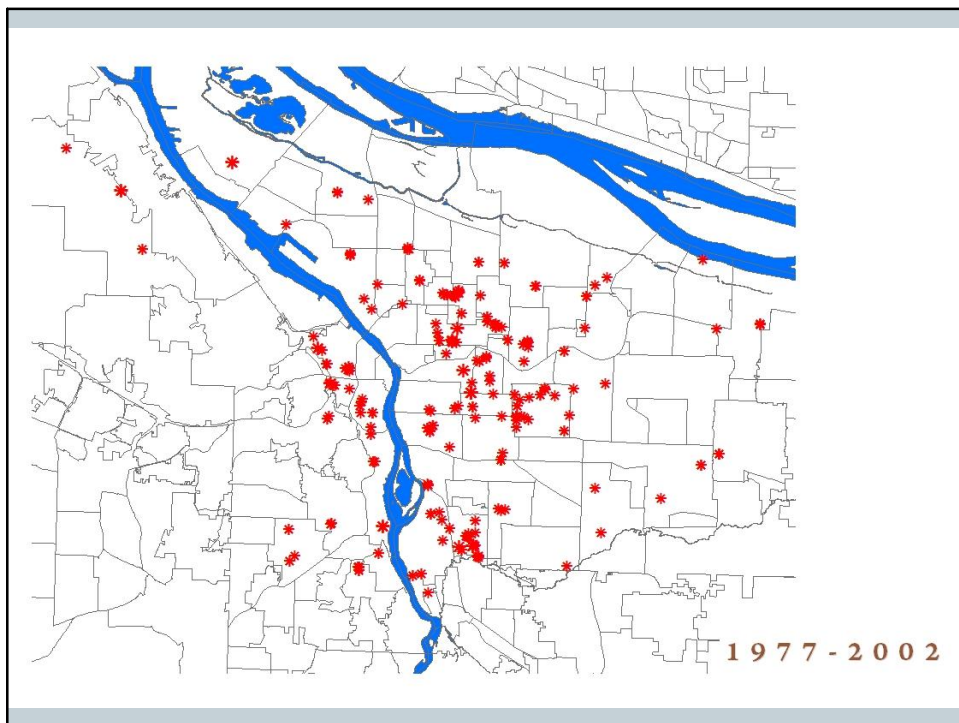

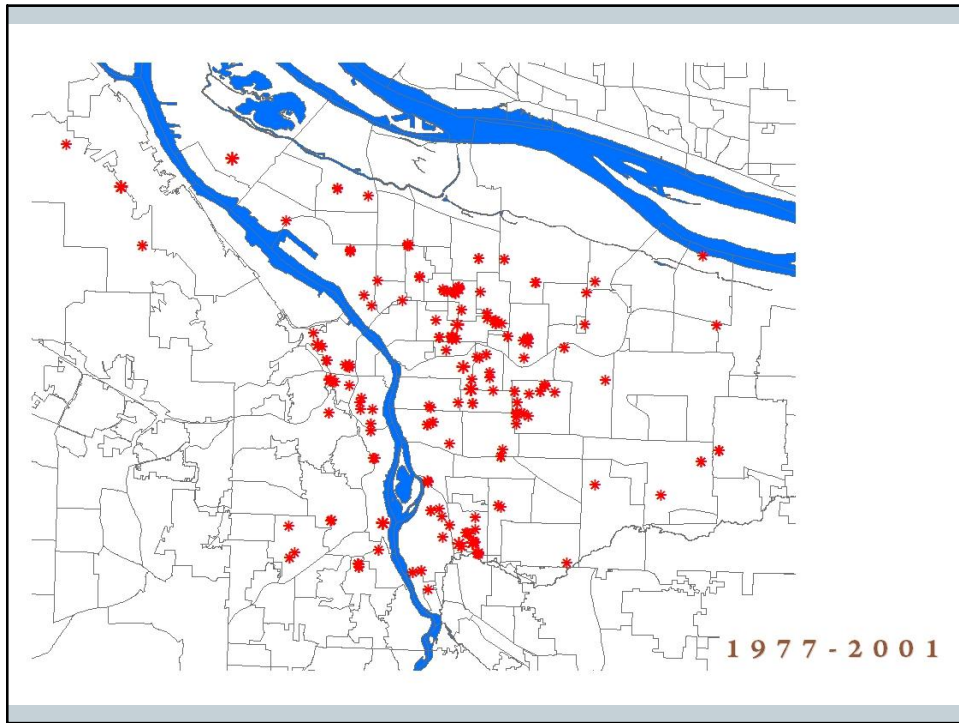

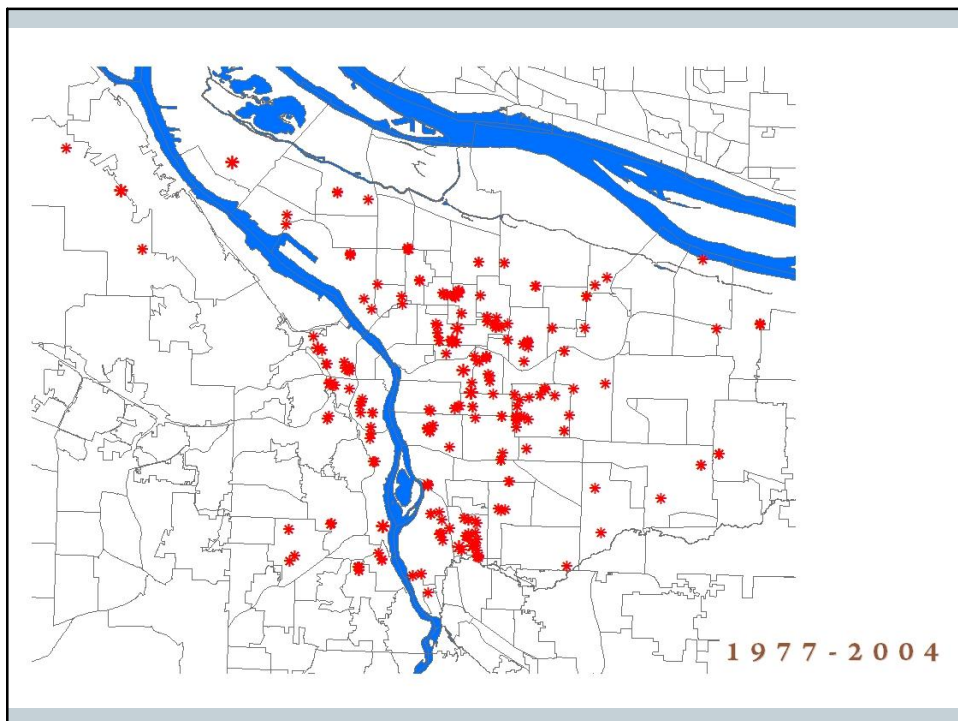

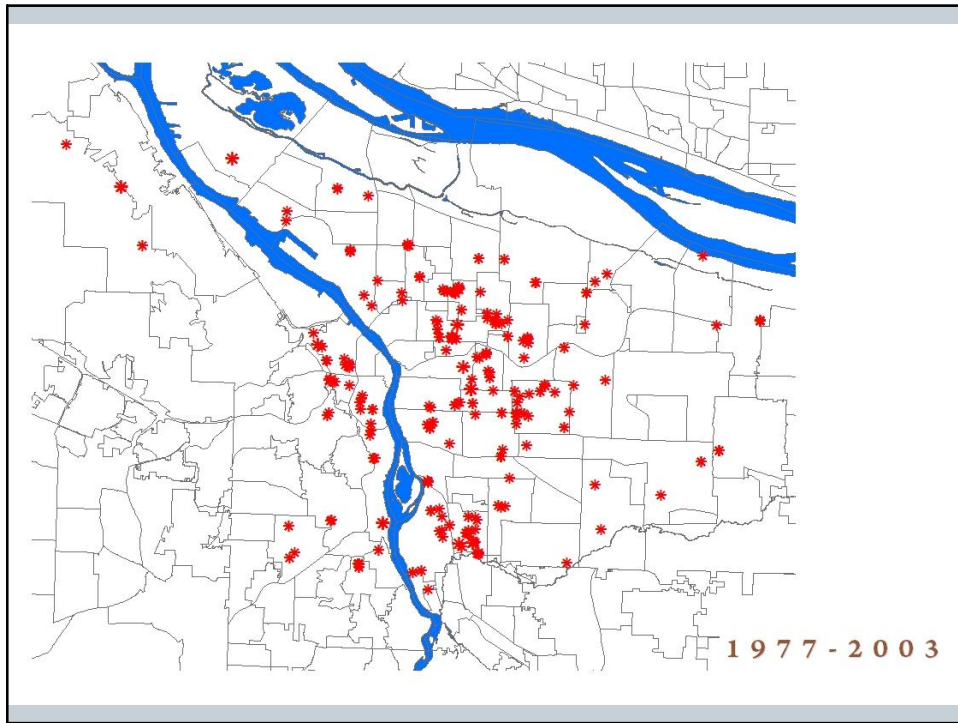

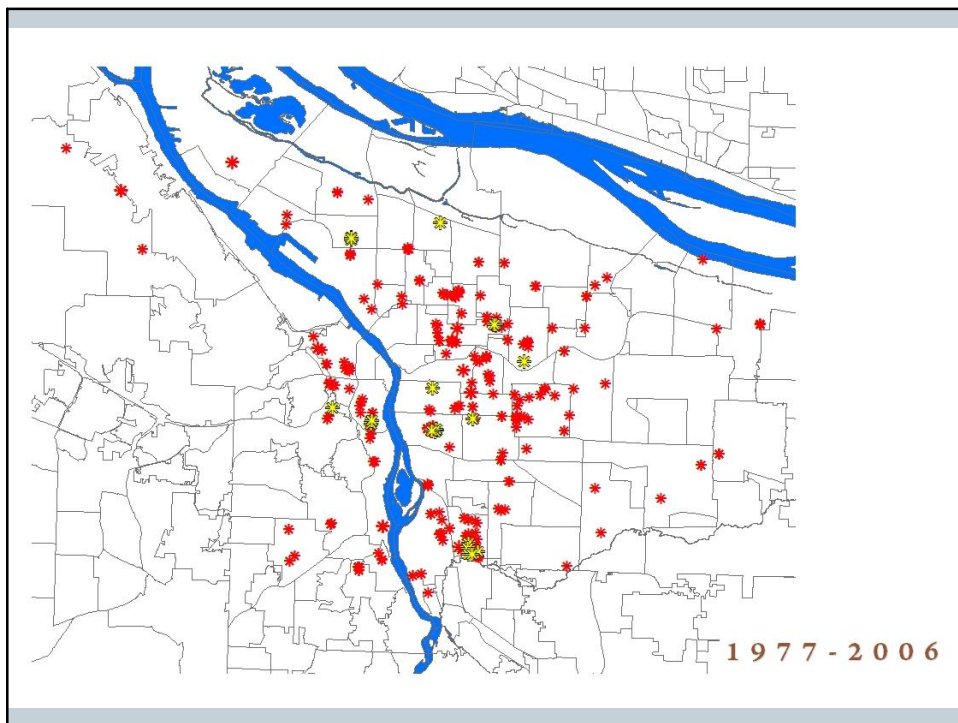

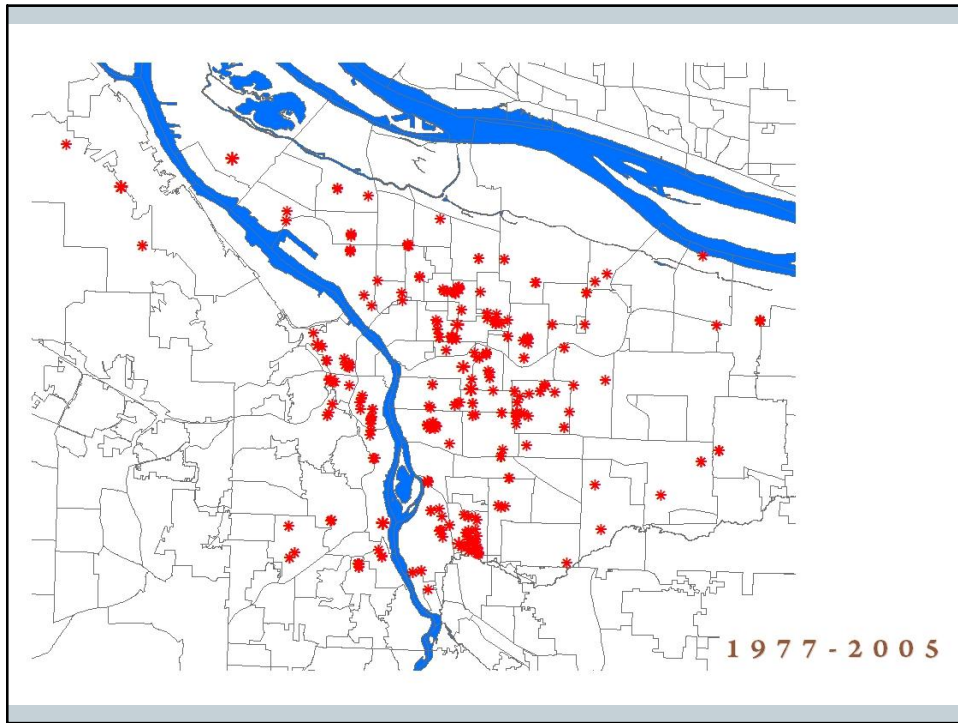

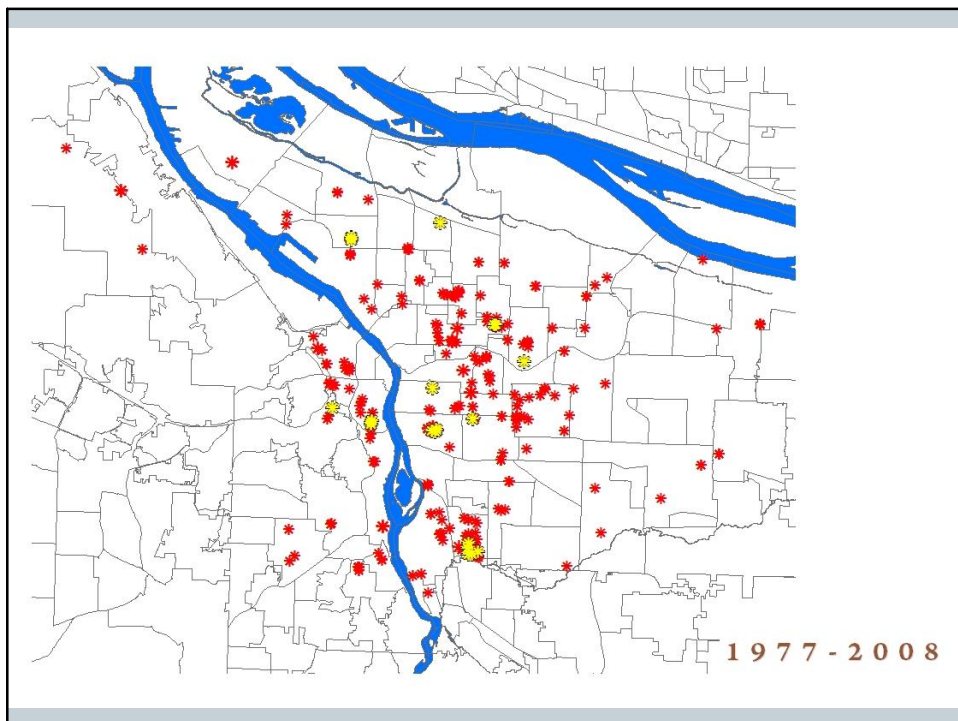

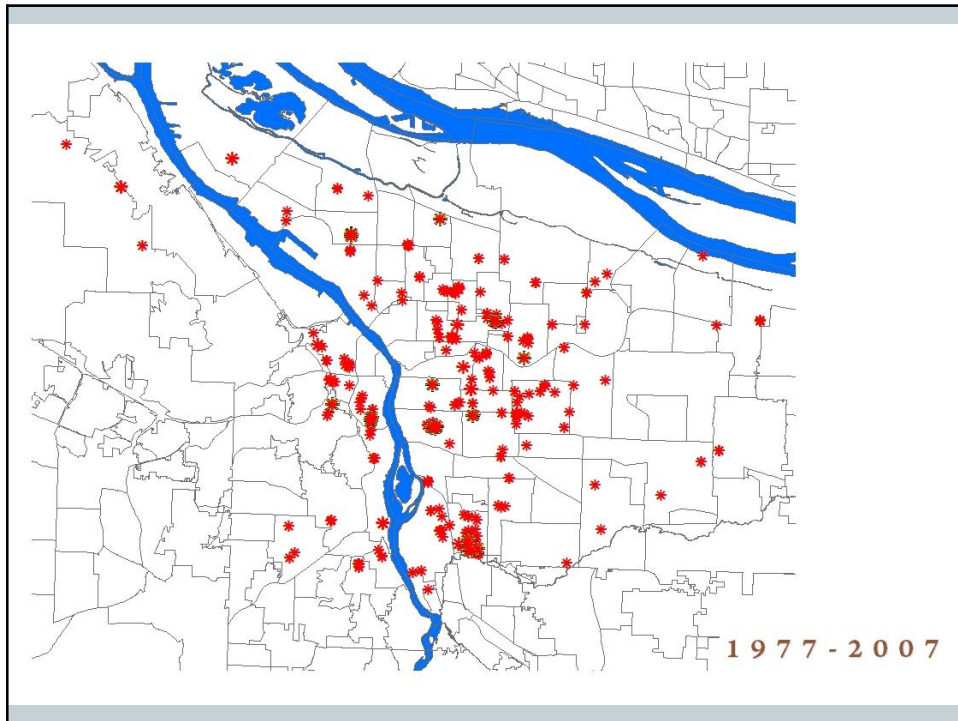

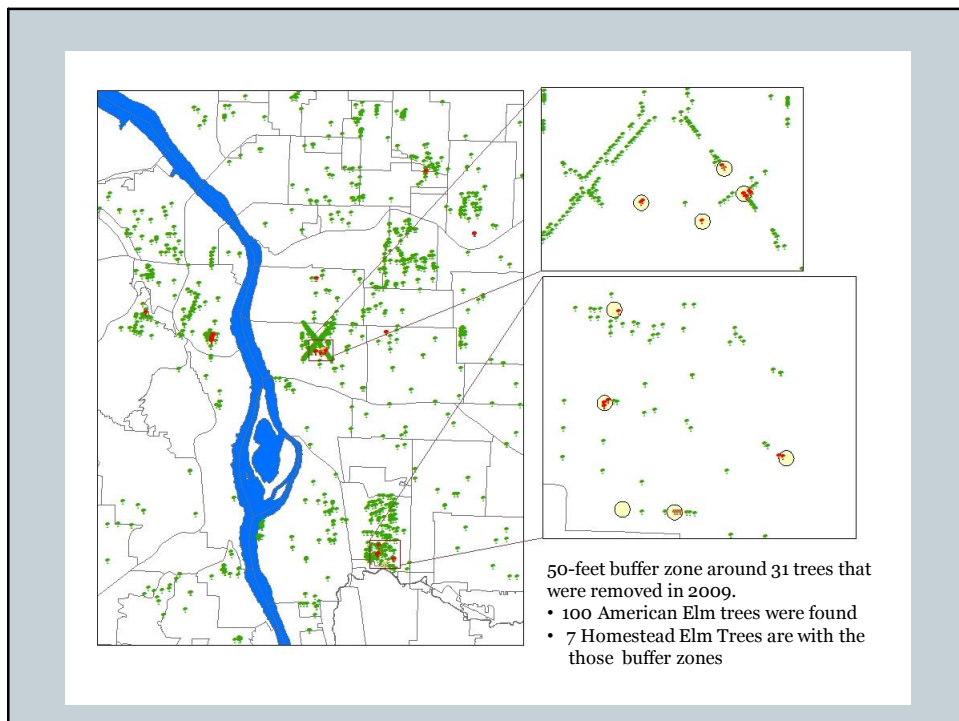

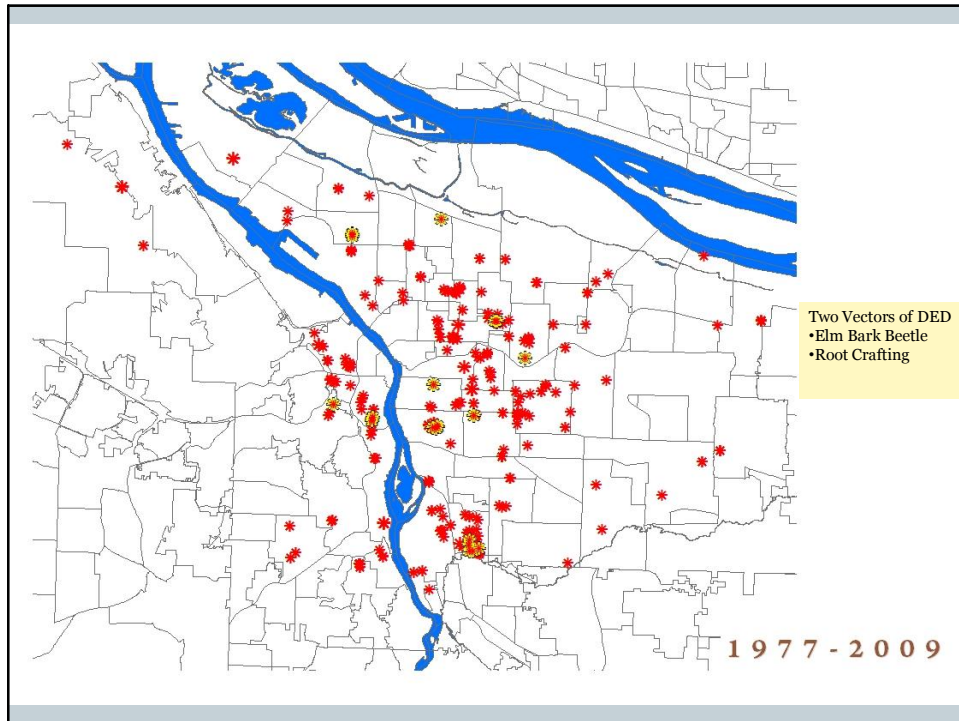

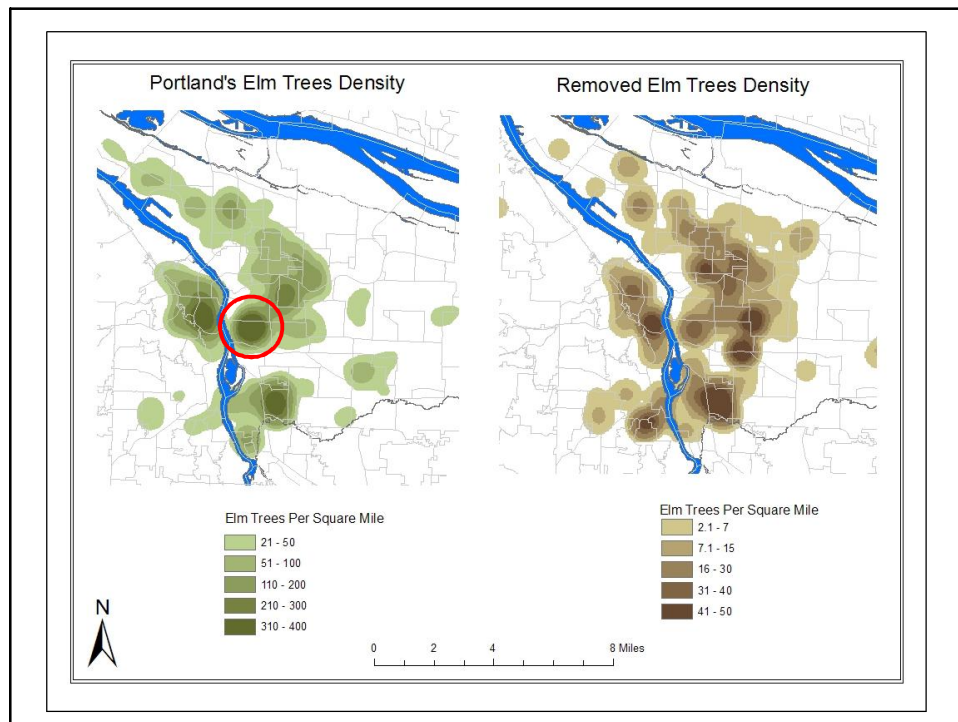

### Data Manipulation:

Excel - Spreadsheets (from Save Our Elms):

INVENTORY + PRUNING + INOCULATION

- correlate, correct and combine all records into one table
- add REMOVAL field (from Final Report)
- add FID field for "Join" with Attribute table

Arcmap – shapefiles (from Portland Parks and RLIS):

ELMS + STREETS + TAXLOTS

- select and export features in Ladd's Addition

Compare spreadsheet with shapefile attribute table:

- Edit / estimate existing tree locations in shapefile
- Correct / eliminate incorrect tree / address pairs
- Eliminate all non-matching records (based on Table)
- Add missing trees to shapefile (based on Table)

"Join" spreadsheet to  
'Ladd Elms' shapefile

Attribute Table:

FID	REM	INOC	PRUN	TD	SP	Address	Di
213	1	0	0	0	a	2205 Ladd	
218	1	0	0	0	a	1704 Lavender	
254	1	0	0	0	a	2229 Orange	
316	1	0	0	0	a	2145 Ladd	
0	0	3	3	11	h	2036 Larch	
1	0	3	3	8	h	2100 Larch	
2	0	1	1	46	a	2100 Larch	
3	0	1	2	27	a	2110 Larch	
4	0	1	2	22	a	2110 Larch	
5	0	1	2	24	a	2110 Larch	
6	0	3	3	2	h	1321 Birch	
7	0	3	3	14	h	1321 Birch	
8	0	3	3	6	h	1331 Birch	
9	0	3	3	2	h	1331 Birch	
10	0	3	3	11	h	1341 Birch	
11	0	3	3	6	h	1349 Birch	
12	0	3	3	10	h	1349 Birch	
13	0	1	1	8	a	1349 Birch	
14	0	1	1	7	a	1349 Birch	
15	0	1	1	8	a	1349 Birch	

Age (Trunk Diameter):

Pruning Status:

Species (American or Homestead):

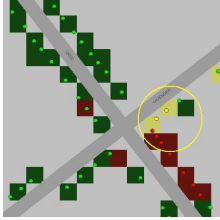

Inoculation Status:

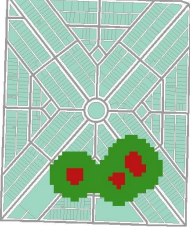

Removals (2009):

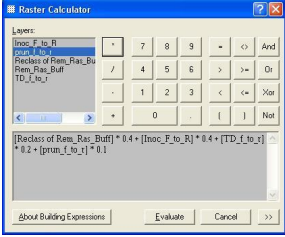

**Spatial Analyst:**  
Convert Feature to Raster

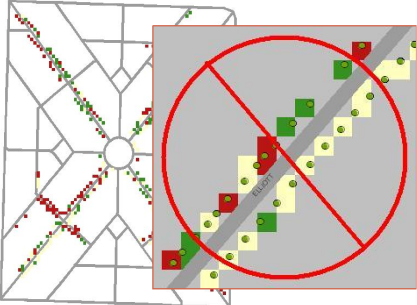

**Analysis Tools:**  
Buffer

**Spatial Analyst:**  
Raster Calculator

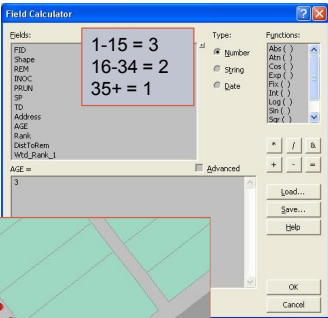

We found raster data to be inappropriate for our analysis

Use Point Data for analysis:

- add Age field to attribute table
- 'Field calculate' values based on Tree Diameter

FID	Shape *	REM	INOC	AGE	PRUN	SP	TD	Address
323	Point	0	3	0	3	h	15	1810 Elliott
326	Point	0	3	0	3	h	15	1903 Elliott
369	Point	0	3	0	3	h	15	1719 Ladd
397	Point	0	2	0	1	a	15	1943 Hemlock
348	Point	0	2	0	1	a	16	1936 Hemlock
301	Point	0	1	0	1	a	17	2204 Ladd
334	Point	0	2	0	1	a	17	1718 Hazel
346	Point	0	2	0	1	a	17	1931 Hemlock
355	Point	0	2	0	1	a	16	1955 Hemlock
363	Point	0	2	0	1	a	16	1978 Hemlock

Age:

- Select by Location
- Export each selection to new shapefiles
- Assign values to 'Distance To Removal' (Field Calculator)

0-100

100-300

300+

- Append files into one main shapefile
- Add 'Rank' field to attribute table

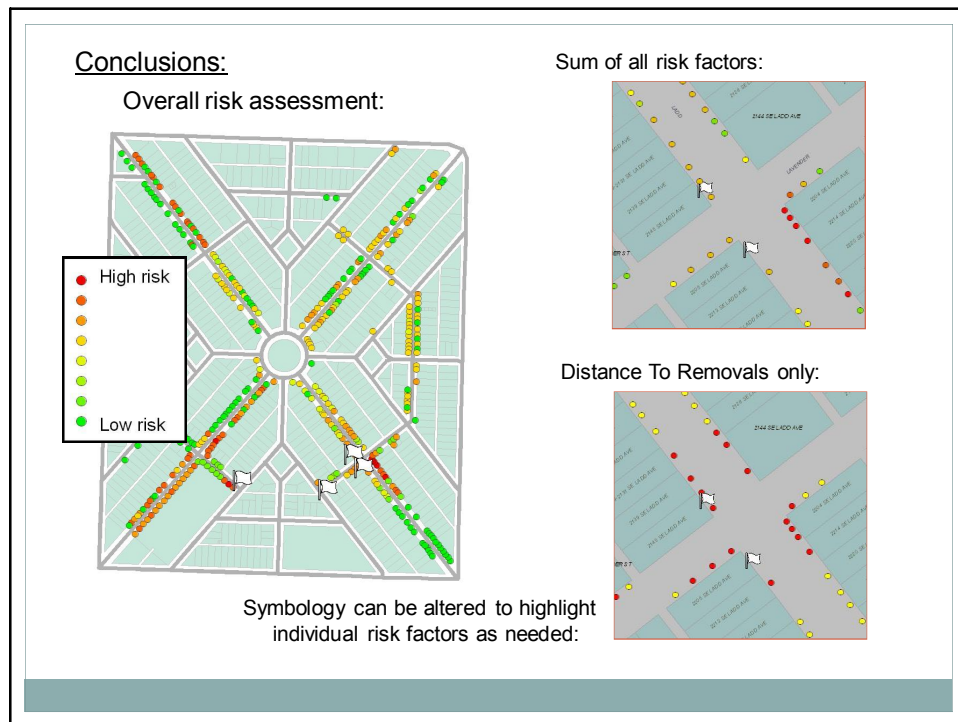

Summed Risk Factors using Field Calculator:  
 = (DistToR) + (Inoc) + (Age) + (Prun)

FID	DistToRem	MIOC	AGE	PRUN	Rank	SP	Address	TD	REM	Shape
80	3	2	1	1	7	n	1143 Elkst	39	0	Point
81	3	2	2	1	8	n	1138 Elkst	28	0	Point
82	3	2	1	1	7	n	1127 Elkst	37	0	Point
83	3	2	1	1	7	n	1127 Elkst	35	0	Point
84	3	2	2	1	8	n	1119 Elkst	26	0	Point
85	3	2	2	1	8	n	1109 Elkst	33	0	Point
86	3	3	3	3	12	n	1140 Elkst	14	0	Point
87	3	2	1	1	7	n	1145 Elkst	52	0	Point
88	3	2	1	1	7	n	1145 Elkst	44	0	Point
89	3	3	3	3	12	n	1107 Elkst	10	0	Point

FID	DistToRem	MIOC	AGE	PRUN	Wtd_Rank_1	Rank	SP	Address	TD	REF
322	1	1	1	2	3	5	a	2214 Ladd	37	
332	1	1	2	1	4	5	a	2204 Ladd	24	
333	1	1	2	1	4	5	a	2204 Ladd	21	
334	1	1	2	1	4	5	a	2204 Ladd	17	
323	1	3	2	1	5	7	a	2213 Ladd	34	
324	1	3	2	1	5	7	a	2205 Ladd	31	

4 Highest Risk Trees:

### Challenges / Limitations of project:

- 1) accuracy and completeness of data
- 2) Project planning – raster vs. vector analysis?
  - Raster analysis did not lead to useful conclusion at 'Ladd' scale

### Alternative methods:

- 1) Assess risk by using the AHP
- 2) Ranks (1,2,3) can be altered as needed using field calculator and a weighted equation

This stage of the project is somewhat limited in accuracy for some trees. Data updates, refinement of methods, and additional input from the 'Save Our Elms' organization can make this a valuable tool used to monitor and prevent the spread of DED.
