

GIS2 Final Project

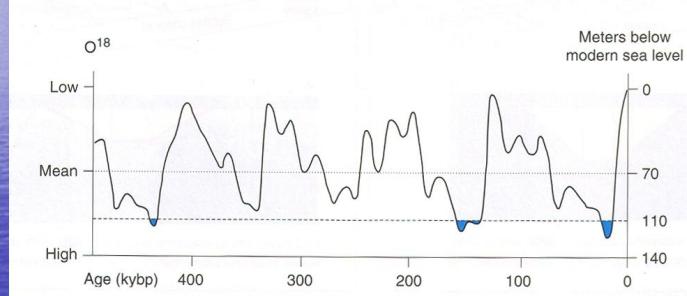

Effect of temporal sea level variations
on the formation of prehistoric Oregon
coast sand dunes

Leonard Powell
Ray Hennings

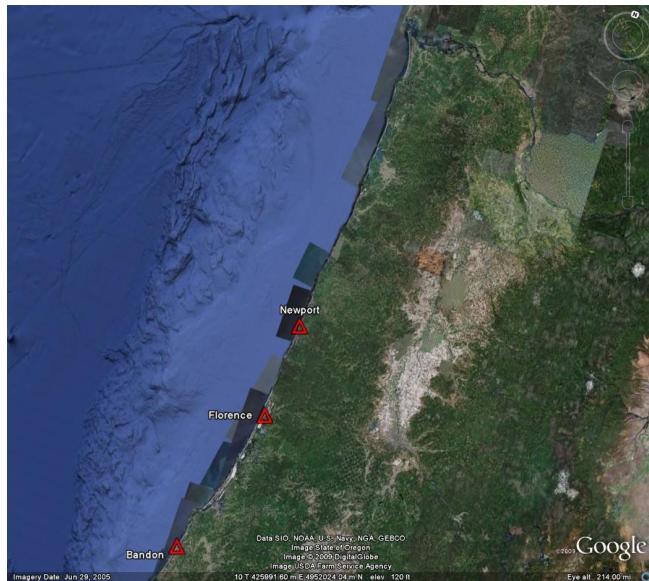

Overview

- Shoreline Recession Simulation
- Pleistocene shoreline width /dune depth correlation
- Arc Scene Visualization
- Conclusions / lessons learned

Sea Level Variations

Study Area

Google Earth Animation

- Modified KML sea level rise code
- Animation using time slider
- Limitations
 - Can't create movie with time animation
 - Limited to Google Earth imagery
- Animation

Correlation between Pleistocene shore width and Pleistocene dune depth

- Limited to sites with large number of data points
 - Florence
 - Newport
 - Bandon
- Analysis of:
 - sum of all Pleistocene layers
 - Pleistocene loess layers only

Correlation between Pleistocene shore width and Pleistocene dune depth

● Process

- Create Map in ArcMap with:
 - Bathymetry layer, georeferenced sampling points
- Use Near tool to determine distance to closest Pleistocene shoreline
 - Bathymetric data started at 200 meters
- Export table to Excel
 - Calculate correlation coefficient

Correlation between Pleistocene shore width and Pleistocene dune depth

The figure displays four Microsoft Excel windows side-by-side, each showing a table of data and a calculated correlation coefficient.

Top Left Window: Microsoft Excel - band_PDBw_near.xls

ID	UTM_N	UTM_E	UNITS	TOP	BOTTOM	THICKNESS	NEAR_DIST	Correlation Coefficient =

Arc Scene Visualization

- Visualize Dune Layers
 - Newport
 - Bandon

- Create layers from points
 - Inverse Distance Weighting: Top
 - Inverse Distance Weighting: Thickness
 - Convert Raster to Points then Points to Polygons

Conclusions / Lessons Learned

- Low correlation between Pleistocene shoreline width and dune depth
- Obtain expertise in phenomena being studied
- 3D tools can enhance understanding of processes and data
