COMPONENTS IN A THYLAKOID MEMBRANE

400 PSU/ μm^2 600 Chlorophylls/PSU

PSII	400 kdal
cyt b ₆ f complex	100 kdal
PSI	500 kdal

How much carbon is needed for these components?

Membrane

$$7.5 \times 10^{-3} \mu\text{m} \times .86 \times 10^{-12} \frac{\text{g}}{\mu\text{m}^3} \times 94\% = 6 \times 10^{-15} \frac{\text{g}}{\mu\text{m}^2}$$

thickness density Lipids are 94% C by weight

PROTEIN

$$400 \frac{\text{PSU}}{\mu\text{m}^2} \times 10^6 \frac{\text{daltons}}{\text{PSU}} \times \frac{1}{6 \times 10^{23}} \frac{\text{g}}{\text{dalton}} \times 72\% = 4.7 \times 10^{-15} \frac{\text{g}}{\mu\text{m}^2}$$

protein is 72% C by weight

Chlorophyll

$$400 \frac{\text{PSU}}{\mu\text{m}^2} \times 600 \frac{\text{Chl molecules}}{\text{PSU}} \times 394 \frac{\text{g}}{\text{mol}} \times \frac{1}{6 \times 10^{23}} \frac{\text{mole}}{\text{molecule}} \times 74\% = 2.3 \times 10^{-15} \frac{\text{g}}{\mu\text{m}^2}$$

Chlorophyll is 74% C by weight

TOTAL

$$13 \times 10^{-15} \frac{\text{gC}}{\mu\text{m}^2}$$

$$\frac{\text{TOTAL C}}{\text{Chlorophyll}} = \frac{13}{2.3} = 5.6$$
